

**Amendments to the Claims:**

This listing of claims will replace all prior versions, and listings, of claims in the application:

**Listing of Claims:**

1. (Currently Amended) A coal-fired power generation system comprising means for the production of coal-derived gas and a filter system for the filtration of said coal-derived gas, said filter system comprising at least one high temperature and corrosion resistant filter (10); said filter comprising a filter medium (12) and filter caps (14); said filter medium comprising at least one layer, said layer being a web of metal fibers which has been sintered, said filter caps and said metal fibers being made from a Fe-Cr-Al based alloy, said alloy having one of the following compositions

15 to 25 wt% Cr, 4 to 6 wt% Al, at least one additional element selected from the group consisting of Sc, Y, Ti, Zr, Hf, V, Nb, Ta and the lanthanides, the remainder being Fe;

up to 15 wt% Cr, 20 to 60 wt% Al, at least one additional element selected from the group consisting of Sc, Y, Ti, Zr, Hf, V, Nb, Ta and the lanthanides, the remainder being Fe;

wherein an  $\text{Al}_2\text{O}_3$  layer is formed on the surface of said filter, said  $\text{Al}_2\text{O}_3$  layer being predominantly  $\alpha$ -  $\text{Al}_2\text{O}_3$ , **wherein said  $\text{Al}_2\text{O}_3$  layer has almost no defects.**

2. (Previously Presented) A system according to claim 1, wherein said metal fibers have a diameter between 4  $\mu\text{m}$  and 30  $\mu\text{m}$ .

3. (Previously Presented) A system according to claim 1, wherein said filter medium comprises at least a first layer and a second layer, said first layer comprises a web of metal fibers with a diameter between 4  $\mu\text{m}$  and 12  $\mu\text{m}$ , said second layer comprises a web of metal fibers with a diameter between 12  $\mu\text{m}$  and 30  $\mu\text{m}$ , the first and second layer are brought into contact with each other to form a layered structure, and wherein said layered structure is sintered.

4. (Previously Presented) A system according to claim 1, wherein the filter medium has a porosity between 60 and 85%.

5. (Previously Presented) A system according to claim 1, wherein a mesh is fixed to the filter medium at the flow out side, said mesh is made from a Fe-Cr-Al based alloy.
6. (Previously Presented) A system according to claim 3, wherein a mesh is sandwiched between the first and the second layer of metal fibers before the medium is sintered, said mesh being made from a Fe-Cr-Al based alloy.
7. (Previously Presented) A system according to claim 1, wherein the additional element is Y with a concentration between 0.03 and 0.5 wt%.
8. (Previously Presented) A system according to claim 7, wherein the Y content ranges between 0.25 and 0.35 wt %.
9. (Previously Presented) A system according to claim 1, wherein the sum of the additional elements is between 0.01 and 1 wt%.
10. (Cancelled)
11. (Cancelled)
12. (Previously Presented) A system according to claim 1, wherein said filter is a candle filter or a tubular filter.
13. (Previously Presented) A system according to claim 12, wherein said system comprises a number of filters arranged in multiple arrays.
14. (Previously presented) The filtration of hot gases in a system according to claim 1 at temperatures higher than 850°C.
15. (Previously presented) The filtration of hot gases in a system according to claim 1 at temperatures of about 1100°C.
16. (Cancelled)

17. (Previously presented) A system according to claim 1, wherein said filtration of said coal-derived gas occurs in a reducing atmosphere.
